## S1, Mathematics , Unit 1: SET

**LESSON 1:** Describing sets, Set Notation, Membership of a set; Number of members(elements) in a set

Presented by Tutor: **Louis Thelesphore**  
**MUNYEMANA**

# Unit 1: SET

## 1.1 Introduction to set concept

**Def: a set is** A group of items with a common feature

➤ Examples of sets are:

a set of animals, a set of houses, set of cars and so on.

An object or item in a set is called a **member or an element** of the set.

# 1.2 Describing sets

- ▶ There are three methods commonly used to describe or represent a set
  - (i) Statement form method
  - (ii) Roster or tabular form method
  - (iii) Set builder form method

All these methods are used together with a pair of curly brackets within which the description is enclosed.

- ▶ **(a) Statement form method**

Consider:

- (i) the alphabets a, b, c, d and e.

These letters can be described using a statement as follows: **{the first six letters of the alphabets}**

- (ii) the set of the numbers 2, 4, 6, 8, 10. This can be described as: **{the first five even numbers}** or **{the first five natural numbers divisible by 2}**

- ❖ Individually, identify another five sets and describe them in a similar method.

## 1.2 Describing sets

➤ (b) **Roster or tabular method** Using this method, we describe a set by listing all the elements in it.

❖ **For example,**

consider the set of all the letters in the word Mathematics.

This set can be described by listing all the elements in it.

If we let this set be  $N$ , then  $N = \{m, a, t, h, e, i, c, s\}$

This method of describing sets is known as **Roster or Tabular Method**.

Note that each element is written only once.

For example in the word mathematics, the letters  $m$ ,  $a$  and  $t$ , each appear twice but we list each of them only once

## 1.3. Set Notation

- ▶ A set of subjects ( $S$ ) that you study in Senior one may be:  $S = \{\text{mathematics, physics, chemistry, biology, history, religious education...}\}$ . Capital letters are used to represent sets e.g. set  $S$ . Members of a set are separated by commas and the set is enclosed with a curly bracket  $\{ \}$ .
- ▶ **For example,**
  - 1) a set of odd numbers ( $O$ ) less than 10 can be written as  $O = \{1, 3, 5, 7, 9\}$ .
  - 2) A set of the first six letters of an alphabet ( $A$ ) can be written as  $A = \{a, b, c, d, e, f\}$ .

## 1.4 Membership of a set

- ▶ We use symbol  $\in$  to mean “is a member of” and  $\notin$  to mean “is not a member of”.

For example, given the set  $A = \{1, 3, 5, 7, 9, 11\}$ ,  $5 \in A$  read as 5 is a member of set A.  $8 \notin A$  read as 8 is not a member of set A.

## 1.5 Number of members in a set

- ▶ Consider set  $T = \{0, 1, 2, 3, 4, 5, 6, 7, 8\}$ . The number of elements ( $n$ ) in set  $T$  is 9.

This is written as  $n(T) = 9$ .

The number of elements in the set is called the **cardinality** or **cardinal number** of the set.

- ▶ Suppose  $n(\mathbf{A})$  means the number of elements in set  $A$ .

If  $D = \{\text{days of the week}\}$  then  $n(D) = 7$ .

- ▶ Suppose  $F = \{\text{two legged cows}\}$   $L = \{\text{green men on the planet earth}\}$  then:  $n(F) = 0$  and  $n(L) = 0$ .

- ▶ This means the two sets  $F$  and  $L$  have no members. Therefore sets  $F$  and  $L$  have no cardinal numbers

i.e. 0 is the cardinal number in each case.

# EXAMPLES

▶ **Example 1.1**

List down the set  $G$  of vowels in the word “algebra”.

Solution  $G = \{a, e\}$

▶ **Example 1.2**

Describe set  $B$  using words, given that  $B = \{1, 3, 5, 7 \dots\}$ .

**Solution**

$B$  is the set of all positive odd numbers.

▶ **Example 1.3**

List all the elements of set  $A$  given that  $A = \{x: -3 < x < 8, x \text{ is an integer}\}$ .

**Solution**

The elements of set  $A$  are  $-2, -1, 0, 1, 2, 3, 4, 5, 6$  and  $7$ .

# EXAMPLES

➤ **Example 1.4**

Describe set  $T$  in words, given that  $T = \{x : x = 2n - 1, \text{ where } n = 1, 2, 3, \dots\}$

**Solution**

See Table 1.1

$n$	1	2	3	4	5	6	7
$x$	1	3	5	7	9	11	13

➤ *Table 1.1*

Thus,  $T$  {the set of all positive odd numbers}

# EXAMPLES

▶ **Example 1.5**

Sets A and B are subsets of the set of natural numbers, N. If  $A = \{x : 1 \leq x \leq 7\}$  and  $B = \{x : 2 \leq x \leq 20, x \in \text{set of even numbers}\}$ .

List the members of: (i) set A (ii) set B

**Solution**

(i)  $A = \{x : 1 \leq x \leq 7\}$  means that x is a positive integer between 1 and 7 inclusive.

$$\therefore \{x : 1 \leq x \leq 7\} = \{1, 2, 3, 4, 5, 6, 7\}$$

(ii)  $B = \{x : 2 \leq x \leq 20, x \in \text{even numbers}\}$  means all even numbers between 2 and 20 inclusive.

$$\therefore \{x : 2 \leq x \leq 20\} = \{2, 4, 6, 8, 10, 12, 14, 16, 18, 20\}.$$

$\therefore B = \{2, 4, 6, 8, 10, 12, 14, 16, 18, 20\}$  and  $A = \{1, 2, 3, 4, 5, 6, 7\}$ . Sets A and B share some members, i.e. 2, 4, 6.

# Unit 1: SET

## 1.6 Subset of a set

- ▶ A set can be obtained by taking some or all the elements of a given set to form another set (called subset).
- ▶ **For example,**  
set **B = {cow, goat, pig}** is a set of some domestic animals. Similarly, we can get set **C = {dove, weaver bird, pigeon}** which is a set of birds.  
Set **D = {tilapia}** which is a set of fish and so on.
- ▶ A set that is formed by obtaining some elements or all the elements from a given set is called a subset.
- ▶ **The empty**  
set denoted by  $\{ \}$  or  $\emptyset$  is also a subset of any set. A subset is denoted by symbol  $\subset$ .
- ▶ For example:  $A = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$   $B = \{2, 4, 6, 8, 10\}$  means  $B \subset A$  B is subset of A

# 1.7 The number of subsets in a set

- ▶ If the number of subsets of a given set is represented as  $N_s$  then the number of subsets is given by;  $N_s = 2^n$   
Where  $n$  equals the number of elements in the set.

- ▶ **Example 1.6**

Set C has 5 elements. How many subsets does it have?

**Solution**

Since the number of elements is five ( $n = 5$ ) then from  $N_s = 2^n$ , the number of subsets is

$$N_s = 2^5 = 32$$

i.e. the set has 32 subsets.

- ▶ **Example 1.7**

A certain set has 64 subsets. How many elements are there in the set?

**Solution**

Number of subsets ( $N_s$ ) = 64

$$N_s = 2^n \quad 64 = 2^n$$

$$2^6 = 2^n$$

$$n = 6$$

i.e. there are 6 elements.

# 1.7 The number of subsets in a set

► **Example 1.8**

Given set  $B = \{a, b, c\}$ , list all the subsets of set B in your exercise book.

**Solution**

The subsets of set B are  $\{\}$ ,  $\{a\}$ ,  $\{b\}$ ,  $\{c\}$ ,  $\{a, b\}$ ,  $\{a, c\}$ ,  $\{b, c\}$  and  $\{a, b, c\}$ .

**Note:** The number of subsets is obtained by the formulae  $2^n$  where  $n$  is the number of elements in a set.

**Example 1.9**

Given set  $A = \{2, 4, 6, 8\}$ , find the number of subsets in set A.

► **Solution**

Number of subsets =  $2^n = 2^4 = 16$  subsets.

# 1.8 Subsets of numbers

- ▶ Natural numbers are counting numbers from zero to infinity. The set of natural numbers is represented as set  $\mathbf{N} = \{0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12 \dots\}$ .
- ▶ **Even numbers** are numbers divisible by 2. Set E of even numbers is represented as set  $\mathbf{E} = \{2, 4, 6, 8 \dots\}$ . Therefore, the set of even numbers is a subset of the set of natural numbers. This can be represented as  $E \subset N$ .
- ▶ **Odd numbers** are numbers which are not divisible by 2. The set of odd numbers is represented by  $\mathbf{D} = \{1, 3, 5, 7, 9, 11, 13, 15, \dots\}$ . The set of odd numbers is a subset of the set of natural numbers which is written as  $D \subset N$ .

## 1.8 Subsets of numbers

- ▶ **A prime number** is a number which is divisible by one and itself only. In other words, prime numbers have only two factors. The set  $P$  of prime numbers is represented as set

$P = \{2, 3, 5, 7, 11, 13, 17, \dots\}$ . The set of prime numbers is a subset of natural numbers represented as  $P \subset N$ .

# 1.9 Venn diagrams

- ▶ The circular pattern used to represent a set and its elements is called a Venn diagram.

## **Example 1.10**

Given set  $A = \{2, 4, 5, 7, 8\}$ , represent set A on a Venn diagram.

- ▶ **Solution:**
